**FOAM
ALIGN**

**NOW you can
spread
fertilizer
accurately**

- **In the right place**
- **At the right time**
- **For the right price**

Spreading fertilizer straight after cutting (when grass really needs it) is a very "hit and miss" affair, given the combination of a short grass stubble and a confusing lattice work of tractor wheelings covering the field.

The FOAMALIGN blob marker allows the tractor driver to see where his last bout line was, by automatically dropping large blobs of foam under the tractor. These are used as a guide on the return bout. The ability to spread accurately eliminates the risk of ugly striping and ensures proper distribution of fertilizer.

FoamAlign Single Blob Marker for accurate fertilizer spreading

The **FOAMALIGN** blob marker is purpose-designed in tough moulded plastic. The moulding is a 25 litre (5.8 gals) capacity reservoir which is sufficient to cover up to 30 acres, (12 hectares) and incorporates a 12 volt compressor to produce the foam.

The **FOAMALIGN** moulding has preformed mounting bolt holes at the sides of the machine for quick and easy fixing to any convenient part of the tractor or spreader.

Also supplied with the machine, are a 1.5 metre length of pipe to carry the foam, and a 3 metre length of cable with a cigar lighter adaptor to plug in for the power supply from the tractor.

BOUTAFOAM FLUID

has been specially developed for the **FOAMALIGN** machine, and incorporates quality detergents, bulk foam boosters, rust inhibitors, water softening agents and stabilisers.

Highly concentrated, it produces stable long life foam marks. Packed in convenient sized bottles each provides enough fluid to mark up to 250 acres.

Red Dye, to further enhance the mark is also available.

- Promotes quick & even regrowth
- Improves yields
- Saves money
- Avoids ugly striping
